

ALL REPORTING SOLUTIONS ARE NOT CREATED EQUAL. IF YOUR ORGANIZATION IS STILL USING SSRS, LASERNET MIGHT BE THE SOLUTION YOU DIDN'T KNOW YOU NEEDED.

SSRS VS. LASERNET COMPARISON

SSRS

Lasernet

DESIGN

SSRS is built for developers, not everyday users. Custom coding is required for design changes and there are limitations on pagination and orphan data (*single line on an extra page*).

Offers a simple and intuitive drag and drop interface that speeds up the generation and modification of document design and output.

INTEGRATION

Unable to integrate with Azure Web Services.

Integrates seamlessly Azure and other third-party applications by using simple properties-dialog boxes rather than code.

LOAD MANAGEMENT

Unable to failover load balance jobs coming through the cloud.

Allows for complete load balancing based on the clients requirements, including failover and load management.

PRINT

Unreliable printer interpretation with when generating barcodes, images, and complex designs.

Ability to drive any printer (*even those not directly accessible from a cloud environment*) using the drivers to ensure all requirements can be covered - from simple to complex documents.

Cannot be driven from cloud solutions.

REPORT DEPLOYMENT

Limited flexibility in deploying customized reports for even simple distribution.

Complete flexibility on deployment, whether your AX or D365 solution is cloud, hybrid or on-prem.

Unable to protect intellectual property.

Distribution options require no coding. Logic and default destinations can be set using data from AX, D365 or standards.
